

COMICCRAFT

AI Comic Story Creator using Gemini Models

PHASE 6: Project Testing Phase

Testing Objective

The testing phase verifies that the ComicCraft application functions correctly from user input through AI generation, comic preview, and PDF export.

Application Testing

- Start the FastAPI server using Uvicorn with reload enabled.
- Open the local ComicCraft homepage in a web browser.
- Enter a story prompt, character name, setting, tone, and art style.
- Submit the form and verify that the comic-generation process starts correctly.

Feature Testing

- Test /generate for complete form-based comic generation.
- Test /generate-comic/json with a JSON payload for API-based generation.
- Test /test-image to verify image generation independently.
- Check that generated panel images are saved correctly.
- Verify that layout_builder.py correctly matches images and story content.
- Verify that save_pdf() creates the final downloadable PDF.

Frontend Verification

- Check that the homepage displays all required input fields.
- Check that comic_preview.html displays panels sequentially.
- Verify panel titles, illustrations, scene descriptions, captions, and narration.
- Verify that the export-success page appears after the download process.

API Verification

FastAPI provides interactive API documentation through /docs, allowing available endpoints to be inspected and tested.

Testing Result

The local deployment is intended to verify that AI text generation, image creation, layout building, frontend rendering, and PDF export operate together as a complete workflow.

Project documentation prepared for phase-wise submission.
