

COMICCRAFT

AI Comic Story Creator using Gemini Models

PHASE 7: Project Documentation Phase

Documentation Objective

The documentation phase records the complete ComicCraft project so that its purpose, architecture, implementation, deployment, and usage flow can be understood clearly.

Project Description

The documentation explains ComicCraft as a web-based AI comic story creator that combines Gemini models for storytelling with Stable Diffusion for comic-style illustrations.

Technical Documentation

- Prerequisites include FastAPI, Uvicorn, Python, HTML/CSS/Jinja2, Google Gemini API, Hugging Face Diffusers, PyTorch, FPDF, Git, and Python environment setup.
- The document explains model selection and the responsibilities of Gemini Flash, Gemini Pro, and Stable Diffusion.
- The architecture section describes frontend, backend, and AI integration responsibilities.
- The workflow documents outline generation, story generation, image generation, layout creation, and PDF export.

Implementation Documentation

- Core functions and their source files are documented.
- FastAPI routes and user-input processing are described.
- Jinja2 templates and dynamic data binding are explained.
- Local deployment, virtual environment setup, dependencies, and environment variables are documented.

User Flow Documentation

The documented pages include the homepage for input, the comic preview page for reviewing the generated comic, the download function, and the export success page.

Documentation Outcome

The documentation provides a structured project record that can be maintained with the source code and used for project submission, demonstration, and future development.

Project documentation prepared for phase-wise submission.
